Jenkins Installation Walkthrough

Step-by-step guide to the first-run Setup Wizard, with the choice to make at each screen.

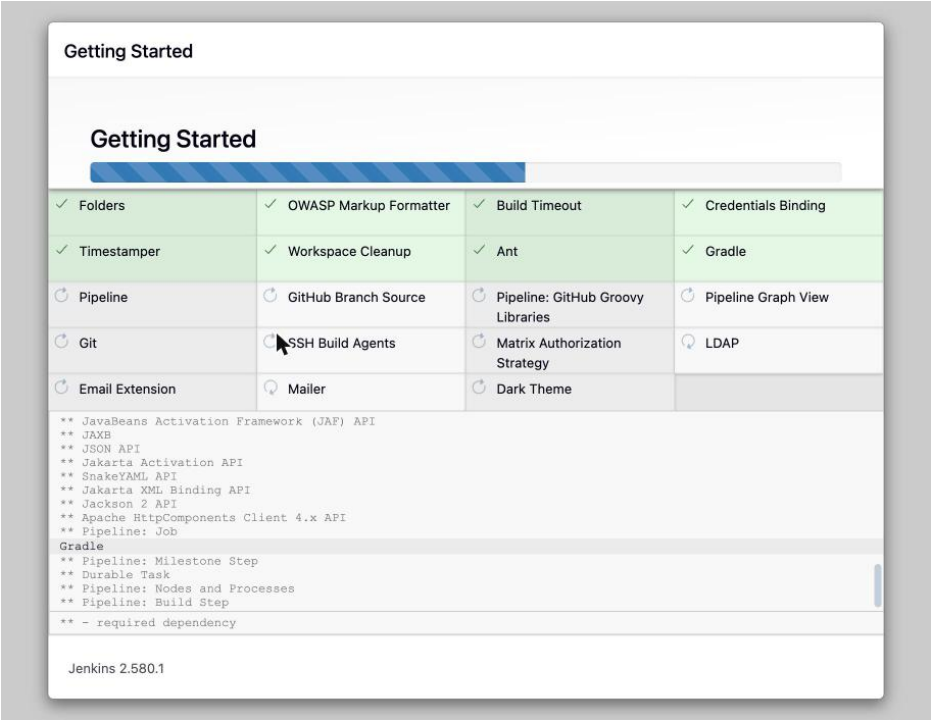

Step 1 — Customize Jenkins

Click “Install suggested plugins”. This installs the standard set of plugins the Jenkins community recommends (Git, Pipeline, Credentials Binding, Timestamper, Workspace Cleanup, etc.) — the right choice for almost every new instance.

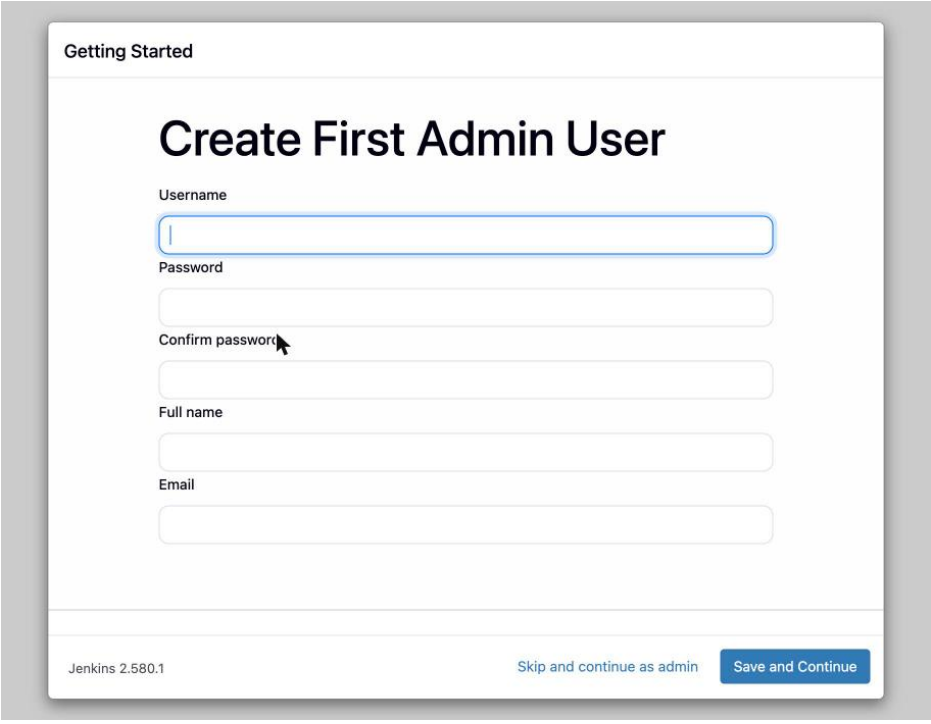

Step 2 — Plugin installation in progress

Jenkins installs the suggested plugins one by one. This can take a couple of minutes depending on the VM's network speed. No action is needed here — just wait for the progress bar to complete.

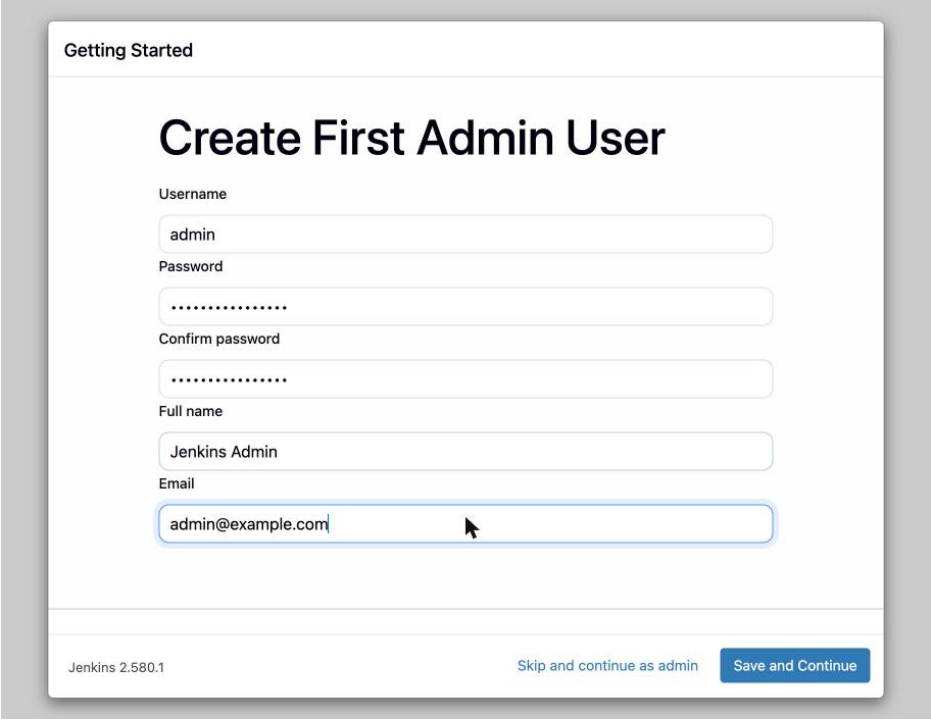

Step 3 — Create First Admin User (empty form)

Fill in Username, Password, Confirm password, Full name and Email. Do NOT click “Skip and continue as admin” — that keeps the temporary initial password as your permanent credential, which is bad practice even on a lab VM.

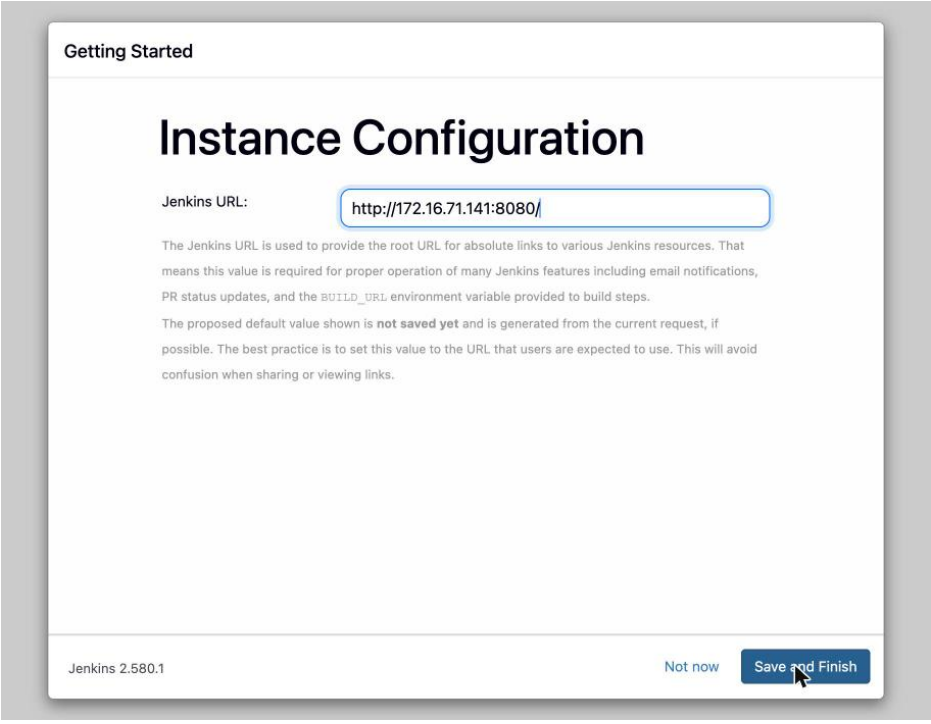

Step 4 — Create First Admin User (filled in)

Example values: Username “admin”, Full name “Jenkins Admin”, Email “admin@example.com”. Notice the Password and Confirm password fields show dots automatically — Jenkins (and the browser) mask the value as you type, so it never appears in plain text on screen. Click “Save and Continue”.

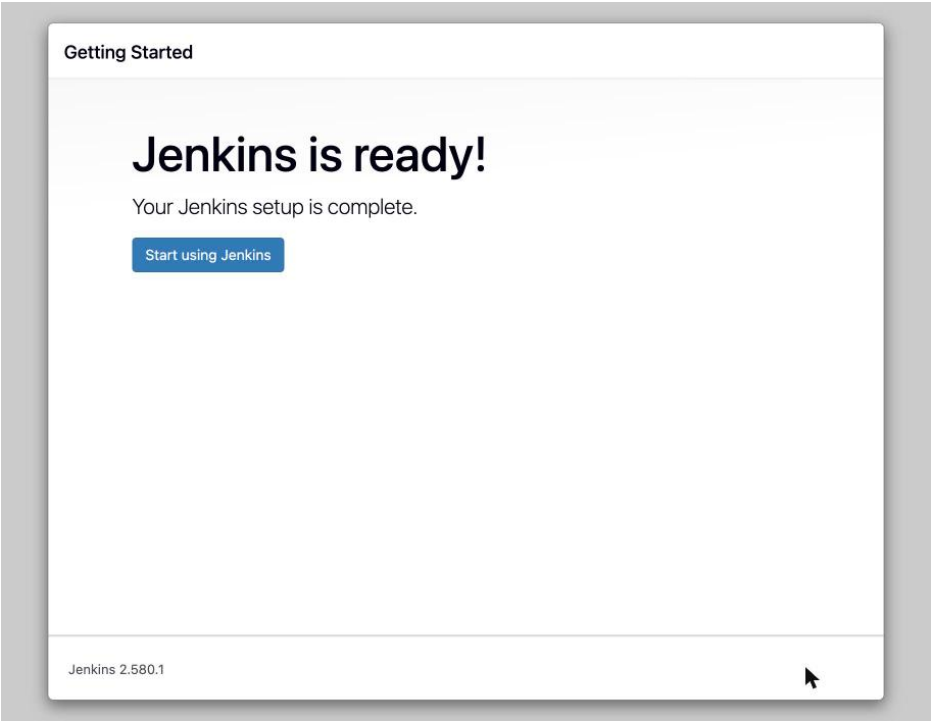

Step 5 — Instance Configuration

Jenkins proposes a Jenkins URL based on the request it just received (here, the VM's IP and port 8080). In almost all cases the proposed value is already correct — leave it as-is and click “Save and Finish”.

Step 6 — Jenkins is ready!

The setup wizard is complete. Click “Start using Jenkins” to land on the main dashboard.

Step 7 — Jenkins Dashboard

This is the landing page you will see from now on every time you log in. From here you can create a new job (“New Item” / “Create a job”), check build history, and manage the instance via the gear icon. This is the starting point for Lesson 01 (creating a Pipeline job).
